FINAL PRESENTATION
WILDCAT FLUID POWER, SUNY POLY
Dr AHMED ABDELAAL
APRIL 2024

The Team

Josh Archanian
Junior, MET

Henry Miller
Junior, MET

Pascal Harrison
Junior, MET

Thiha Soe
Senior, MET

Chris Lam
Junior, MET

Kyle Vedder
Junior, MET

- Mechanical Design Lead
- SolidWorks specialist

- Hydraulic Circuit Design
- Hydraulic system builder and technician
- Rider 2

- Hydraulic systems, circuit, and manifold design
- Systems integration and fabrication mastermind
- Rider 1

- Mechanical design
- Part selection and integration
- Graphic design authority

- Electrical Design Lead
- Master programmer

- Fabrication guru
- Electronics trouble shooting wizard

Design Review

CAD Model

- CAD is an extremely versatile tool.
- The CAD model was used to visualize how components would be integrated.
- It was essential to our success designing and manufacturing.

Fig. 1 Isometric View

Fig. 2 Completed Bike

Fig. 3 CAD Model

Major Mechanical components

Fig. 4 Chain Drive System

Fig. 5 Gearbox

Fig. 6 3D Model of Back Plate

Fig. 7 Flattened Model of Reservoir

Gearbox

2-Speed Gearbox[®]

- Cable-controlled
- Low range for starting (3.78:1)
- High range for cruising and regen (6.22:1)

Fig. 8 Gear Selector

Fig. 9 2-Speed Gearbox

Calculations

Sprocket ratio

- Our ideal ratio was 1:10
- CR = Compound Ratio
- N_i = Number of teeth on respective sprocket

Fig. 10 Drive Chain Sketch

$$CR = \frac{N_1}{N_2} * \frac{N_3}{N_4}$$

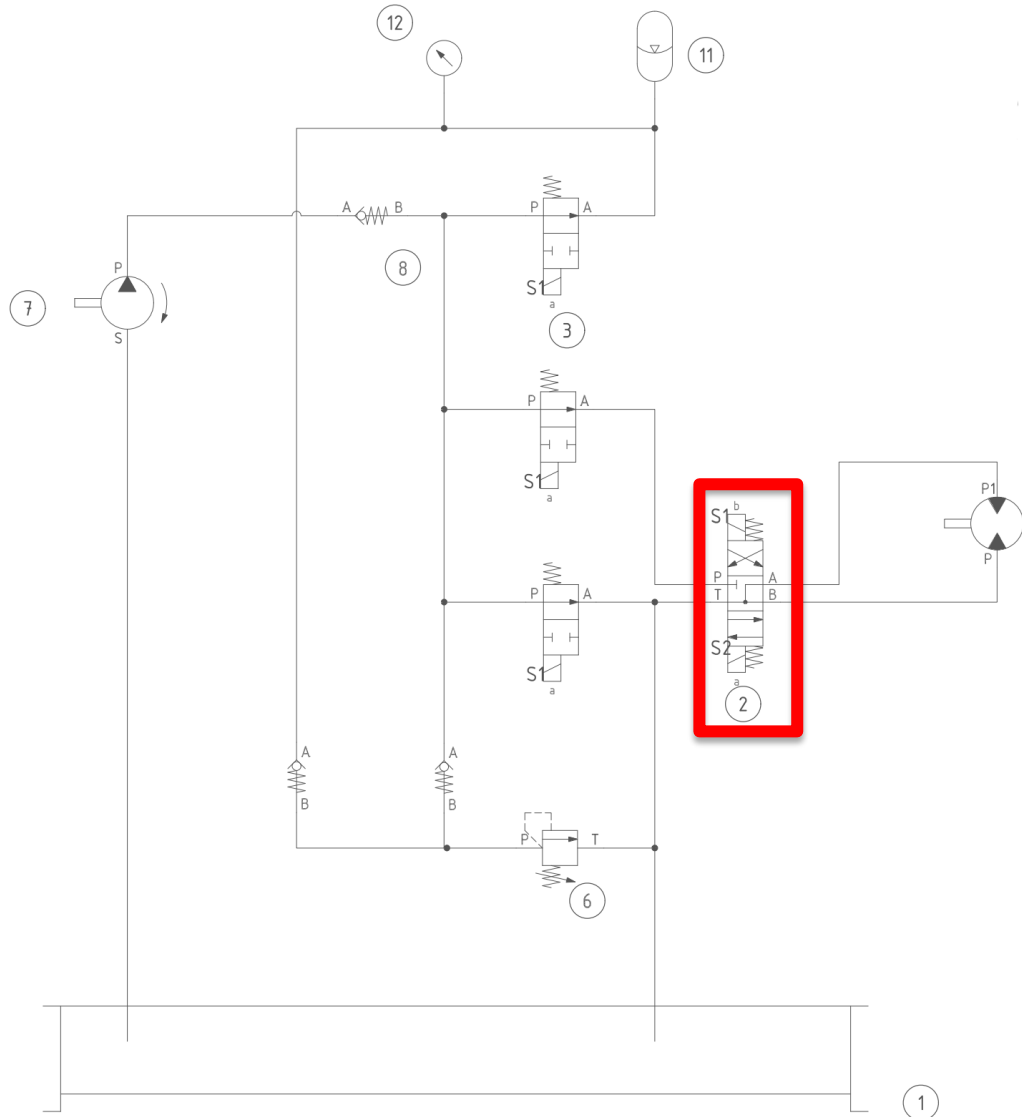

$$CR = \frac{46}{12} * \frac{23}{9}$$

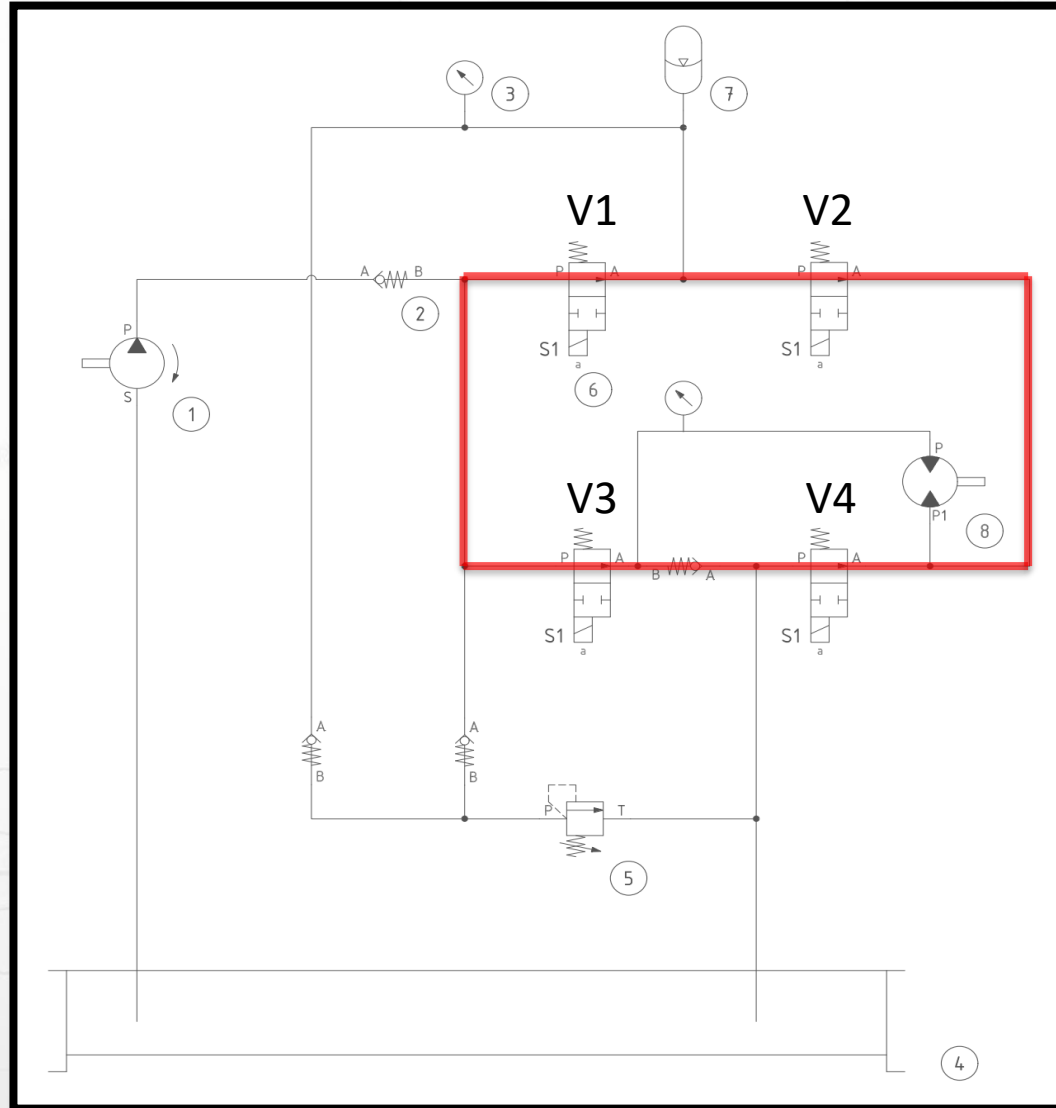

$$CR = 1:9.8$$

Vehicle Build

Hydraulic Reservoir

- 2 pieces bent stainless steel
- Designed for construction with a single continuous weld
- ¼ inch polycarbonate viewing window to monitor level and condition of fluid
- Vented cap

Programing User Interface

The user interface is displayed on a dark blue background with a gold border. At the top left, there is a red indicator light and a lightning bolt icon next to a blue box containing the text "0.00 Volts". To the right of this are two blue buttons with gold borders labeled "REGEN" and "DRIVE". Below these are three circular gauges with blue faces and gold borders. The first gauge on the left has a red needle pointing to 0 and is labeled "0 PSI x100" with a battery icon. The middle gauge has a red needle pointing to 0 and is labeled "0 MPH" with a speedometer icon. The third gauge on the right has a red needle pointing to 0 and is labeled "0 PSI x100" with a battery icon. At the bottom left is the Wildcat Fluid Power logo, and next to it is the NFFPA Fluid Power VEHICLE Challenge logo. At the bottom right are two blue buttons with gold borders labeled "CHARGE" and "DISCHARGE".

Programing User Interface

The dashboard is a dark blue rectangular area with a black border. At the top left, there is a red indicator light and a lightning bolt icon next to a blue box containing the text "0.00 Volts". Below this are three circular gauges with blue faces and yellow borders. The first gauge has a battery icon and is labeled "0 PSI x100". The second gauge has a speedometer icon and is labeled "0 MPH". The third gauge has a battery icon with a plus sign and is labeled "0 PSI x100". At the top right are two buttons: a blue "REGEN" button and a red "DRIVE" button. At the bottom left is the Wildcat Fluid Power SUNY POLY logo. At the bottom center is the NFPA Fluid Power VEHICLE Challenge logo. At the bottom right are two buttons: a blue "CHARGE" button and a blue "DISCHARGE" button.

Gearbox Gremlins

- We needed to flip the entire mounting plate over after realizing the gearbox had a one-way bearing

Fig.40 Clutch Delete Coupling

Fig.41 Manufacturing Improved Coupling

- Original motor to gearbox connection was threaded, to our surprise it came loose during testing
- Manufactured new coupling
- Manufactured $\frac{1}{2}$ inch pitch sprocket to fit 9 tooth spline output shaft

Fig. 42 Improved Coupling

Modifications After Testing

- **Speedometer Problems**

- Sensor from consumer grade bicycle speedometer worked intermittently and could not respond at a high enough frequency (1680 Hz – 1900 Hz)
- Replaced with a magnetic hall sensor (15 kHz rated)

Fig. 43 Magnetic Hall Sensor

Fig. 44 Low Quality Reed Switch

Modifications After Testing

- **Chain tensioner**
- Fabricated custom rear chain tensioner to mitigate derailing issues

Fig. 45 Drive Chain System

- **Larger rear sprocket**
- Increased diameter of rear sprocket to increase acceleration, regen pressure, and ease of riding

$$MPH = \frac{\text{wheel circumference} \times \frac{\text{motor speed}}{\text{drive ratio}} \times 60 \text{ min/hr}}{63360 \text{ inches/mile}}$$

18T (Drive Ratio of 2.428:1) = Theoretical Top speed of 27.45 MPH

28T (Drive Ratio of 3.775:1) = Theoretical Top speed of 17.67 MPH

Lessons Learned

Lessons Learned

- Components and parts do not always function as expected (check valves, gearbox, reed switch, accumulator charging kit)
- Purchasing lead times must be considered when scheduling.
- Scope creep is a big factor during fabrication especially for new or unfamiliar processes and when building from the ground up.
- Fluid powered bikes are inherently difficult to ride and do not balance themselves.

Fig.46 Attempting to diagnose regen issue

Acknowledgements

- We would like to extend our heartfelt appreciation to the NFFA for making this competition possible and believing in SUNY Polytechnic
- We thank all of our mentors and sponsors for your invaluable contributions, it goes without saying, but we could never have done it without you
- There are those to whom we owe a particular debt of gratitude
 - Josh Scarbrough and Jeff McCarthy for your exemplary and ever-ready assistance and expertise
 - Dr. Ahmed Abdelaal, our team advisor, biggest fan, and unwavering supporter through the highs and the lows of our first year.
